

# Menk USA Radiators

Sterling, IL

Menk USA cooling radiators are built to keep transformers from overheating. The radiators hold cooling oil for the transformers and if they corrode, they leak oil, and thus the transformers have to be shut down. As the transformers are sometimes installed in corrosive environments, such as coastal regions, it is imperative the radiators are able to withstand these harsh conditions.

Menk USA decided to hot-dip galvanize the radiators and fan guards because of the coating's durability and corrosion resistance. However, the radiators are very thin and can warp easily, so they require some special handling to ensure they meet the high standards of the transformer industry. By electing to galvanize the cooling radiators, Menk USA delivers a dependable product to its customers that will avoid critical shutdowns and a coating that will remain maintenance-free for many years.
